## GARDiS Software Version 3.2

GARDiS Pro Software V3.2 introduces a comprehensive set of new features and enhancements designed to strengthen security, improve connectivity and further enhance overall system performance. This latest update reflects our continued commitment to delivering a robust, future ready access control solution that evolves in line with customer needs, industry standards and emerging technologies.

Version 3.2 delivers meaningful improvements across security, notifications, alarm management and wireless locking integration, while also refining the overall user experience. Alongside strengthened system communications and expanded functionality, this release enhances the wireless locking experience with improved integration and management capabilities. A series of refinements have also been introduced to make licensing and commissioning more straightforward, helping installers and system administrators reduce setup time and complete deployments more efficiently and with greater confidence.

### At a Glance

#### Uhlmann & Zacher (U&Z) Wireless Locking Integration

Version 3.2 introduces integration with Uhlmann & Zacher Wireless Locks, extending the flexibility of the GARDiS platform. This enables seamless management of compatible wireless locking devices within the GARDiS software, improving configuration, monitoring and control of wireless doors. The enhanced integration supports a smoother wireless locking experience, providing greater convenience while maintaining centralised system oversight.

### Feature Updates

- Uhlmann & Zacher (U&Z) Wireless Locking Integration
- AES Encryption between GARDiS Software and GARDiS Controllers
- Endpoint Alerts - Ability to send notifications to an Endpoint
- Audible Alarm Option
- Licensing and Commissioning Enhancements

GARDiS v3.2 is available now and can be downloaded from the TDSi Product Registration site. We encourage all partners and customers to upgrade to v3.2 and take advantage of the latest features and improvements. For assistance with the update process, please contact our support team who will be happy to help.

### About TDSi

**Robust and reliable Access Control Systems manufactured by world-renowned security specialists TDSi for the last 40 years.**

Protecting and securing your building, assets, and people is a high priority for any business. However, those responsible for building security often find themselves overwhelmed by choice. TDSi is a specialist in access control, offering a range of superior products that not only answer the security challenges of the 21st century but delivers peace of mind to those who trust in our expertise and experience.

## **GARDiS Software Version 3.2 New Feature Glossary**

### **Security Update - AES Encryption**

GARDiS Pro v3.2 introduces AES encryption between the software and GARDiS controllers, significantly enhancing the security of system communications. This ensures that data transmitted across the network is protected against unauthorised access or interception, providing greater assurance for customers operating in security sensitive environments.

### **Notifications - Endpoint Alerts**

The new notifications feature enables the system to send events directly to a designated endpoint, such as a mobile phone. This capability allows users to receive real time alerts for important system activity, improving responsiveness and ensuring critical events are not missed. Implementation of Endpoint Alerts are setup and initiated using the GARDiS App which distributes notifications via Google Firebase.

### **Alarms - Audible Sound Option**

Alarm functionality has been expanded to allow end users to trigger an audible sound when required. This enhancement improves on site awareness and provides an immediate audible indication of alarm events, supporting faster response and increased operational control.

### **Licensing and Commissioning Enhancements**

In addition to the new features, V3.2 includes a range of refinements aimed at simplifying licensing and commissioning. These enhancements streamline setup processes, reduce configuration time and improve overall usability, making system deployment more efficient for installers and administrators.
